

RecordRelay

Production-grade data cloning engine — clone records across databases with full referential integrity, field masking, and CLI/Desktop/IntelliJ plugin interfaces.

<https://github.com/MstroCA/recordrelay>

A tester found a bug.
We couldn't reproduce it.
This happened every single week.

The problem

Tester

100-screen dataset

Their flow

Developer

100-screen dataset

Their flow

They're never the same dataset.

What we did instead

Our team lead would open DBeaver.

Find the root table.

Trace every relationship manually.

Copy the data to local.

10–15 minutes. Every single time.

It worked. But it didn't scale.

So I started building

Step by step:

1 → Stored procedure

2 → Desktop .exe

3 → First real user

I reproduced a production bug
in under a minute.

I've been doing this manually
for years.

Then support engineers started using it.

They reproduced production bugs
before escalating to dev.

Desktop App

CLI

IntelliJ Plugin

I named it RecordRelay.

Clone Context

Export Package

Önizle

STEP 1 — SELECT CONNECTION

Source (Source Database)

Target (Target Database)

postgres1-company

postgres2-analytics

☐ Export mode — save as .rrpkg file (no live cloning)

STEP 2 — TABLE & RECORD

Load Tables ↺

28 tablo

Tables load automatically when source is selected. Enter the root table and record ID.

Root Table

users

Detect

Primary Key Column

id

Record ID

1

Suggested root tables (click to select):

users · ×8

customers · ×5

orders · ×6

orderitems · ×3

accounts · ×2

System follows relationships from this table and copies all connected records.

STEP 3 — OPTIONS

Relationship depth (how many tables to traverse)

3

☐ Mask PII (email, phone, address, IBAN, national ID)

On conflict

Regenerate IDs (default)

STEP 4 — FIELD OVERRIDES (OPTIONAL)

+ Add

Remove

Override field values in the target environment (e.g., created_by). Empty table applies to all tables.

Table (empty=all)	Column	New Value
-------------------	--------	-----------

LOG

Tamamlandı — 20 kayıt kopyalandı (4 uyum)

Kopyalanıyor: users #1 | postgres1-company → postgres2-analytics | derinlik=3

İlişki keşfedildi: 9 edge

Çekiliyor: users

└ 1 kayıt

Çekiliyor: accounts

└ 1 kayıt

Çekiliyor: sessions

└ 1 kayıt

Çekiliyor: audit_logs

PREVIEW RESULT

10 tablo · 20 satır · 73 ms

Table	Row Count	Depth
users	1	0
accounts	1	1
audit_logs	3	1
customers	2	1
notifications	2	1

How it works

Source DB → Entity + ID → Local clone

All FK relationships resolved automatically.
All related tables extracted.
One click.

What changed

Reproduce a bug

BEFORE: 10–15 min manual work

AFTER: Under 1 minute ✓

Developer confidence

BEFORE: Can't reproduce on my machine

AFTER: Reproduced every time ✓

Support flow

BEFORE: Always escalated to dev

AFTER: Fixed before escalation ✓

Open source. Free.

 Desktop ·  CLI ·  IntelliJ Plugin
